

FarmerMind AI Overview

Guidance, planning and farm records for supported Windows and Android devices.

Built around farm decisions

Bring crop guidance, calendars, tasks, farm records, reports and bookkeeping into one agricultural workspace. FarmerMind supports the path from a question to a planned action and a useful record. Outputs are decision support and may be incomplete or incorrect.

Useful when connectivity drops

Work with available local records, bundled guidance and cached information offline. Fresh weather and satellite data, website services and updates require connectivity. Features vary by release and platform. Windows Rev474 does not enable image diagnosis; Android does not include Sensors.

A directory for agricultural communities

Marketplace in the current Windows edition is a directory of reviewed business and farmer profiles supplied with OS updates. Browse available listings by country. Company links open public business pages; farmer details introduce their work. The directory provides no person-to-person chat or transactions, and local farm records are not automatically published.

Company and farmer participation

Website application, approval, public listing, OS publication and billing are separate steps. For the new workflow, trials wait for confirmed OS publication and a start date manually entered by FarmerMind AI. New automated enrollment and loyalty rewards remain unavailable until their required checks are complete.

Built for farmers and agricultural teams

Install on compatible devices you already own. FarmerMind is seeking pilot partners and early-stage investor conversations. Next milestones include structured field pilots, repeat-use measurement and verified listing delivery across platforms.
