

From a crop problem to the next farm action.

An offline-first agricultural software suite for Windows and Android. Guidance, planning and farm records in one connected workflow.

OBSERVE > UNDERSTAND > PLAN > RECORD

THE PROBLEM

Farmers make time-sensitive decisions with fragmented advice, scattered records and unreliable connectivity. An answer is most useful when it leads to work that can be planned, completed and remembered.

THE PRODUCT

Bring crop guidance, calendar and task planning, farm records, reports and bookkeeping into a single suite. Keep local records and bundled or cached information useful when connectivity drops.

THE DIFFERENCE

A workflow built around the season: investigate a crop issue, plan the next action and preserve the farm record. Install on existing devices without a dedicated hardware purchase.

CUSTOMERS & DISTRIBUTION

Built for farmers, agricultural teams, co-ops and extension organizations. Download channels: Microsoft Store and Google Play. Partner-led demonstrations and field pilots are the route to wider adoption.

BUSINESS MODEL

Company participation is a monetization channel: reviewed business profiles and paid memberships connect agricultural suppliers with the FarmerMind ecosystem. Website plans are offered after approval; in-app delivery is a separate release step.

BUILT TODAY. MEASURE NEXT.

Windows and Android software, plus a working website company-profile flow. Next milestones: structured field pilots, repeat-use measurement and verified company-listing delivery across platforms.

Seeking pilot partners and early-stage investor conversations.
